

Online Learning Behaviour Analysis

Summary

This project focuses on analyzing online learning behaviour to understand student engagement, learning patterns, and academic performance across different learning environments. The process began with data cleaning and preparation to ensure accuracy, consistency, and proper formatting of the dataset. Data analysis was then performed by applying calculations and aggregations to evaluate key metrics such as course completion, learning hours, quiz attempts, assignments submitted, and student participation. The data was further organized and analyzed across multiple dimensions including country, field of study, device usage, education level, and learning mode to identify meaningful trends and performance patterns. Interactive visualizations, analytical measures, and filters were created to explore the data dynamically and present insights in a clear and user-friendly manner. Finally, an interactive dashboard was developed to monitor key performance indicators and support data-driven understanding of online learning behaviour.
